

MATH3171 (Mathematical Biology III)
YEAR 2025–26, EASTER TERM

CONCESSION VIVA

To help ease you in to the viva, we'd like to start by asking you to discuss how to approach something you've had chance to look at in advance. Please consider the below problem, and be prepared to discuss how you would approach this question. While you're encouraged to prepare this question in advance, note that we're not marking any work prepared in advance of the viva, but instead will be using this as somewhere to begin our discussion on the day.

Please ensure you bring a tablet, or some other device you can use to share your written work as we talk.

At the end of the viva, we will take a few minutes to deliberate amongst ourselves before informing you of our decision, which will be whether you have 'passed' with a mark of at least 60%, or not.

1. Give a 5-minute presentation on the use of reaction–diffusion equations in mathematical biology. Given a system of two interacting and mobile species, how might you model them mathematically? You may wish to use [VisualPDE.com](https://www.visualpde.com) in your explanation.
